2021 Updates to the National Incident Feature Service and Event Geodatabase 01/01/2021

NIFC Org Hosting

Since the migration to ArcGIS Online hosting occurred in mid-season 2020, it is included here again.

The National Incident Feature Service will continue to be hosted in ArcGIS Online for
 2021 and the foreseeable future.

Mobile Edit Service (Formerly 'Collector Services')

- The 2021 Mobile Edit Service will be a single service that contains all the Event Layers and Features.
- All features will be editable (with Delete still disabled).
- Web Map Templates are provided with pop-ups, editing, and visibility settings already configured in the Incident Resources Group.

Schema Changes

- Attachments are disabled for Accountable property
 - The size of attachments was impacting downloads and syncs. PhotoPoints or a separate hosted feature class should be used instead, if needed.
- Event Polygon Attribute Defaults
 - The default values for the IsVisible, FeatureStatus, and FeatureAccess attributes on Event Polygon will be Yes, Approved, and Public (respectively) by default for 2021.

This will allow all perimeters to display in the Public Wildfire Perimeters service without any additional action by the GISS. Changing any of these values will remove a perimeter from the public service, which feeds InciWeb as well as other publicly shared web apps.

Fields Removed

- Collector, ContactName, ContactEmail, ContactPhone
 - AGOL hosting now allows the Editor Tracking on the NIFS to capture the username of each editor, eliminating the need for this information to be entered manually.
- ComplexName, ComplexID, GACC, IMTName, UnitID, LocalIncidentID
 - To reduce the data management workload on GISS and improve consistency and completeness of attribution, these fields (and several new attributes) will be added to a view of the NIFS in EGP and then ported back into the NIFC Org for Reporting Apps and Dashboards.

GeometryID

• No longer in use. This field was originally intended to be used by custom tools which were negated by enhancements to commercial software.

New Fields

- ElevationFeet
 - Added to EventPoint for Air Operations.
- Acres AutoCalc
 - Added to EventPolygon for the InFORM Project.
 This field will be calculated automatically by a geoprocessing service.
 GISAcres will remain manually calculated by the GISS.
- GISS Misc
 - A 50 character text field added to EventPoint, EventLine, and EventPolygon to be used at the discretion of the GISS.

Evacuation and Closure Areas

- EvacuationArea and ClosureArea feature classes have been added to the other_incident_data GDB as a convenient starting point for these data sets.
- These are not part of the official Event Data Standard, and as such, their schema can be modified as needed to suit the incident.
- When publishing to AGOL, remember that Publicly Shared services are not permitted to have Edit or Sync enabled. (See <u>Section 3.2 of the NIFC Org Rules of Behavior</u>)

Archive Service

An EGP account will no longer be required to access the Archive service.
 It will still be hosted in the EGP, but ported back into AGOL for ease of use. A GeoNet post will be forthcoming with the link to the hosted service.

Dashboard Service

- A new service available for 2021, the Dashboard Service is a read-only copy of the NIFS that includes additional incident attributes joined from IRWIN.
- The primary intended use is for Dashboards and Apps in which the additional incident attributes can be used for reporting or filtering.

• Feature Category Updates

- Primary updates include dropping infrequently used features and standardizing the naming conventions for Proposed and Completed line types.
- o Route (EventLine) and Check Point (EventPoint) features added for Air Operations.
- A table of all the changes can be found in Appendix A.

Symbology Changes

The Point and Line symbols have undergone a redesign to give the entire dataset a more cohesive look and bring the Pro and ArcGIS Online symbols closer into alignment.

Additionally, in anticipation of future capabilities to categorize and organize the Event Features, the new symbols have also been designed to coordinate within new groupings based on use. These groups will display in Pro but have no bearing on the data for the 2021 season.

AGOL and Collector symbology will still differ from Pro and printed maps on the Event Line features for 2021.

The most prominent and safety related features have been left unchanged for ease of transition and will likely be part of a smaller update next year.

A detailed list of changes can be found in **Appendix B**.

Appendix B: Symbology Update Details

Accountable Property

Blue Outline Square

Property

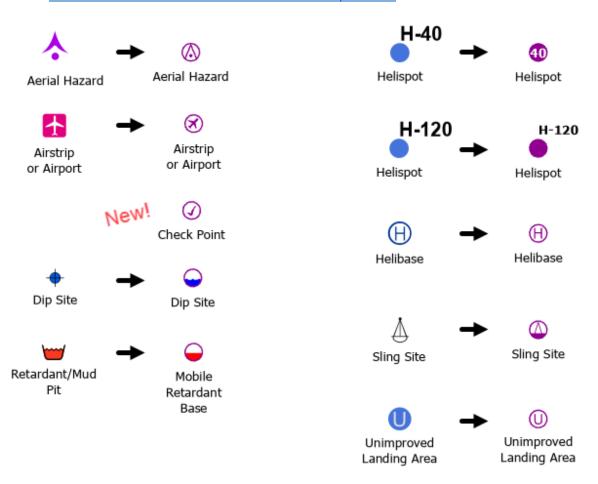

Event Point

Air Operations

Purple Circle

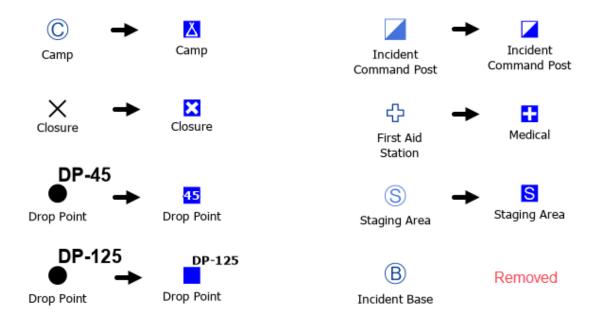

- New Check Point feature added.
- New labeling option for Helispot. Use only the number in the Label field and it will be placed
 inside the circle or include the "H-" and it will be placed adjacent to the feature. Be consistent
 with your choice.
- Retardant/Mud Pit updated to Mobile Retardant Base to conform with naming convention in PMS 508 - NWCG Standards for Airtanker Base Operations.

Logistics

Blue Square

- Incident Base feature removed due to lack of use.
- New labeling option for Drop Point. Use only the number in the Label field and it will be placed inside the square or include the "DP-" and it will be placed adjacent to the feature. Be consistent with your choice.
- First Aid Station updated to Medical to improve usability.

Operations

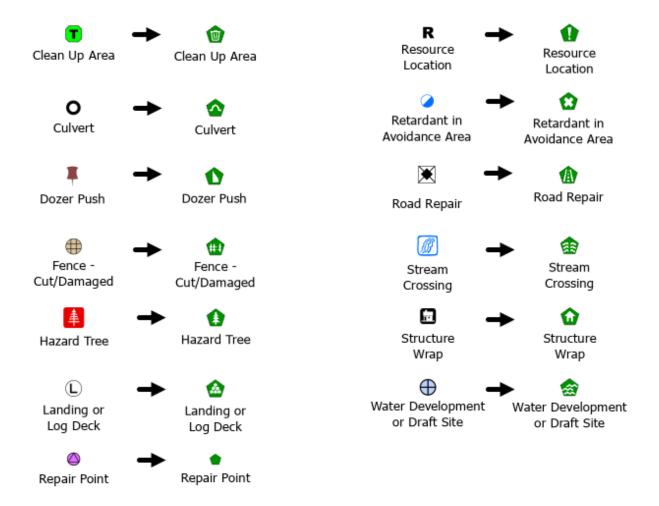

Black Squares

Only a single feature for now, with the possibility for future expansion.

Repair

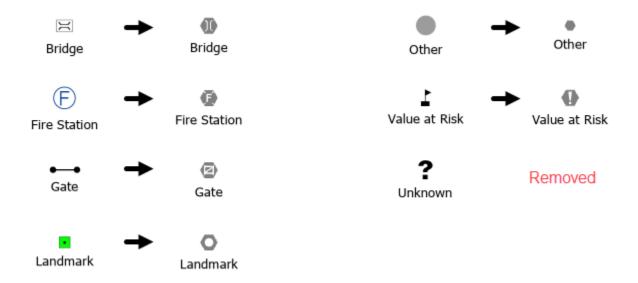

Green Pentagon

Reference

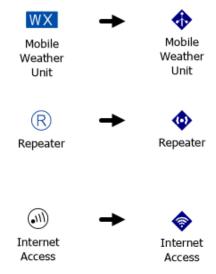

Gray Hexagon

• Unknown feature removed to improve clarity.

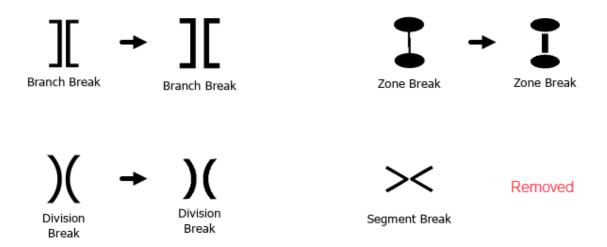

Communications

Navy Diamond

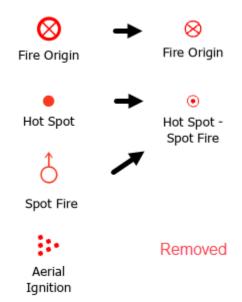

Assignment Breaks

• Segment Break feature removed due to lack of use.

Fire *Red Circle*

- Hot Spot and Spot Fire features combined. Feature within the perimeter should be assumed as Hot Spot and outside the perimeter as Spot Fire.
- Aerial Ignition feature removed due to lack of use.

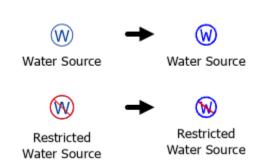

Safety

Yellow and Black

Water *Blue Circle*

Event Line

2021 Event Line AGOL and Feature Service Symbology

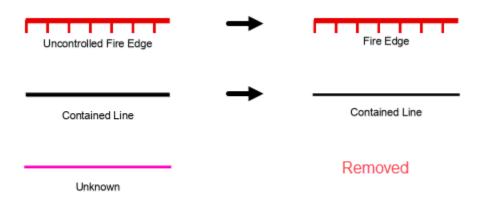

There is still insufficient complexity supported in feature services to allow for a single, cross-platform Event Line symbol set, but the new symbols take a step towards changes that are expected in 2022 to make that possible. Line labels will not yet display in AGOL's basic Map Viewer but will in Collector and Field Maps mobile apps.

2021 Event GDB Line Symbology

Fire Perimeter

- Implementation for the Fire Perimeter features remains the same as 2020. The entire fire perimeter should be covered by either Fire Edge or Contained Line (i.e. there should be Event Line features of only these two categories coincident with the entire fire polygon).
- Unknown feature removed for clarity.

Repair

Brown Lines

Safety

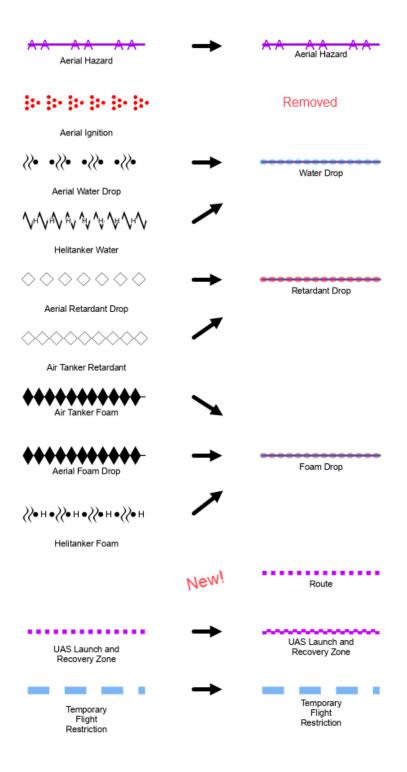

Green Lines

Air Operations

Purple Lines

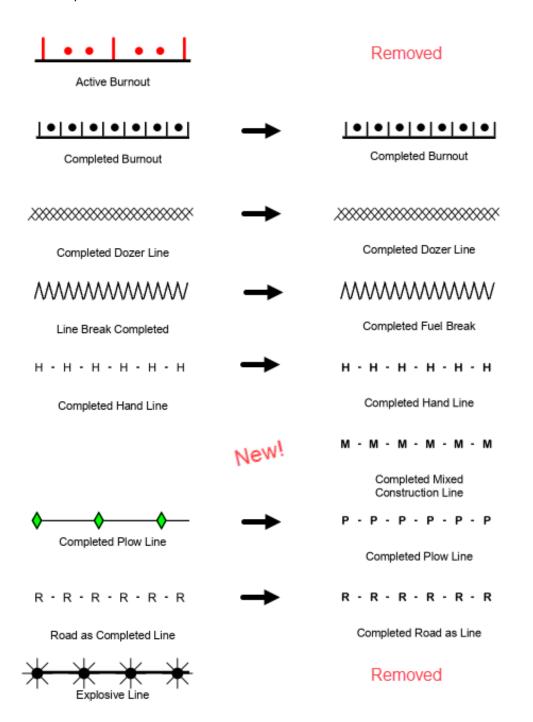

- Aerial Ignition feature removed due to lack of use.
- Drop features combined into Water, Retardant, and Foam to improve clarity.
- Route feature added.

Ops Completed

Black Lines

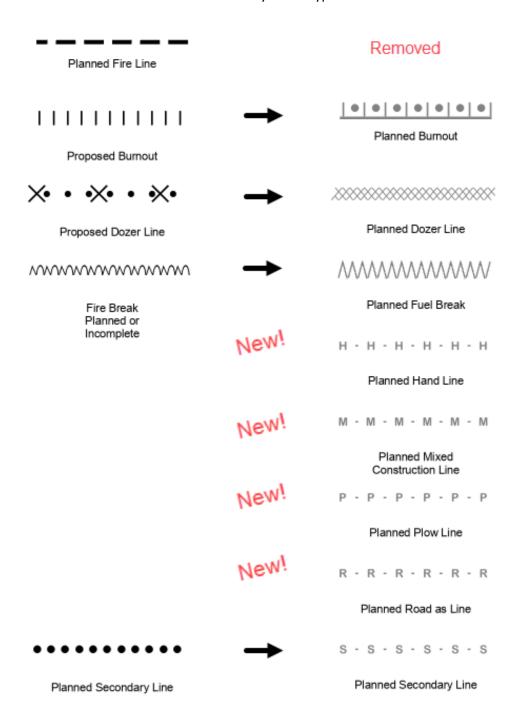

- Active Burnout feature removed due to lack of use.
- Completed Mixed Construction Line feature added for consistency in line types.
- Explosive Line feature removed due to lack of use.

Ops Planned

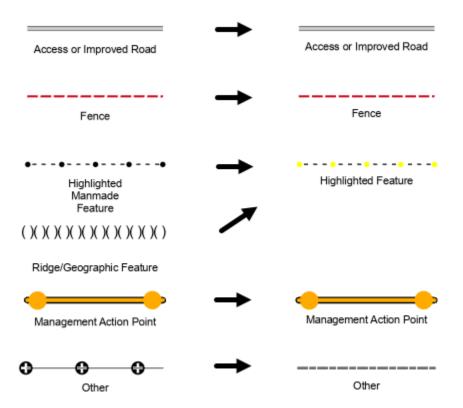

Gray Lines

- Planned Fire Line feature removed for consistency in line types.
- Planned Hand Line, Planned Mixed Construction Line, Planned Plow Line, and Planned Road as Line features added for consistency in line types.

Reference

 Highlighted Manmade Feature and Ridge/Geographic Feature combined into Highlighted Feature for simplicity.

Event Polygon

- The majority of the Event Polygon feature have been removed due to lack of use or the availability of more appropriate data sources/hosting.
- Evacuation Area and Closure Area features should have separate services so they can be shared publicly.
- Retardant Avoidance Areas should be pulled from the authoritative source.
